

MASONRY BLOCK ANCHOR BOLT ASSEMBLY

ABSTRACT

An anchor bolt assembly includes a bolt having an elongate portion and an arcuate end portion integral therewith. The arcuate end portion is positioned within a hollow core of a masonry block with the elongate portion extending outwardly thereof. The assembly further includes a toggle member positionable along the elongate portion and adjacent the arcuate end portion so that the toggle member becomes disposed within a hollow core of a masonry block after being positioned along the elongate portion. The toggle member preferably has a front surface engageable with an interior surface of the masonry block. A nut is threadably positionable at the elongate portion and opposite to the toggle member so that the nut becomes disposed at an exterior of the masonry block.
